	p53
Background	tumor protein p53(TP53) Homo sapiens This
	gene encodes a tumor suppressor protein containing
	transcriptional activation, DNA binding, and
	oligomerization domains. The encoded protein
	responds to diverse cellular stresses to regulate
	expression of target genes, thereby inducing cell
	cycle arrest, apoptosis, senescence, DNA repair, or
	changes in metabolism. Mutations in this gene are
	associated with a variety of human cancers,
	including hereditary cancers such as Li-Fraumeni
	syndrome. Alternative splicing of this gene and the
	use of alternate promoters result in multiple
	transcript variants and isoforms. Additional isoforms
	have also been shown to result from the use of
	alternate translation initiation codons (PMIDs:
	12032546, 20937277). [provided by RefSeq, Feb
