Background	The protein encoded by this gene is a
	transmembrane glycoprotein that is a member of
	the protein kinase superfamily. This protein is a
	receptor for members of the epidermal growth
	factor family. EGFR is a cell surface protein that
	binds to epidermal growth factor. Binding of the
	protein to a ligand induces receptor dimerization
	and tyrosine autophosphorylation and leads to cell
	proliferation. Mutations in this gene are associated
	with lung cancer. [provided by RefSeq, Jun 2016],
