Background	cell division cycle 25A(CDC25A) Homo sapiens CDC25A is a member of the CDC25 family of phosphatases. CDC25A is required for progression from G1 to the S phase of the cell cycle. It activates the cyclin-dependent kinase CDC2 by removing two

phosphate groups. CDC25A is specifically degraded in response to DNA damage, which prevents cells with chromosomal abnormalities from progressing through cell division. CDC25A is an oncogene, although its exact role in oncogenesis has not been demonstrated. Two transcript variants encoding different isoforms have been found for this gene. Western Blot analysis of Jurkat cells using Phospho-Cdc25A (S75) Polyclonal Antibody

Western blot analysis of lysates from Jurkat cells treated with UV, using CDC25A (Phospho-Ser75) Antibody. The lane on the right is blocked with the phospho peptide.
