Background	This gene encodes a member of the ADAMTS (a
	disintegrin and metalloproteinase with
	thrombospondin motifs) and ADAMTS-like protein
	family. Members of the family share several distinct
	protein modules, including a propeptide region, a
	metalloproteinase domain, a disintegrin-like
	domain, and a thrombospondin type 1 (TS) motif.
	Individual members of this family differ in the
	number of C-terminal TS motifs, and some have

unique C-terminal domains. The protein encoded by this gene lacks the protease domain, and is therefore of a member of the the ADAMTS-like protein subfamily. It is a secreted glycoprotein that binds the cell surface and extracellular matrix; it also interacts with latent transforming growth factor beta binding protein 1. Mutations in this gene have been associated with geleophysic dysplasia. [provided by RefSeq, Feb 2009],
